# Zero-inflated models: Poisson, Binomial, negative Binomial and BetaBinomial

#### Parametrisation

There is support two types of zero-inflated models, which we name type 0 and type 1. These are defined for both the Binomial, the Poisson, the censored Poisson, the negative Binomial and BetaBinomial likelihood. For simplicity we will describe only the Poisson as the other cases are similar.

## Type 0

The (type 0) likelihood is defined as

$$Prob(y \mid \ldots) = p \times 1_{[y=0]} + (1-p) \times Poisson(y \mid y > 0)$$

where p is a hyperparameter where

$$p = \frac{\exp(\theta)}{1 + \exp(\theta)}$$

and  $\theta$  is the internal representation of p; meaning that the initial value and prior is given for  $\theta$ . This is model is called zeroinflatedpoisson0 (and zeroinflatedbinomial0).

## Type 1

The (type 1) likelihood is defined as

$$Prob(y \mid \ldots) = p \times 1_{[y=0]} + (1-p) \times Poisson(y)$$

where p is a hyperparameter where

$$p = \frac{\exp(\theta)}{1 + \exp(\theta)}$$

and  $\theta$  is the internal representation of p; meaning that the initial value and prior is given for  $\theta$ . This is model is called zeroinflatedpoisson1 (and zeroinflatedbinomial1).

#### Link-function

As for the Poisson, the Binomial the negative Binomial and the BetaBinomial.

### Hyperparameters

For Poisson and the Binomial, there is one hyperparameter; where

$$p = \frac{\exp(\theta)}{1 + \exp(\theta)}$$

and the prior and initial value is is given for  $\theta$ .

For the negative Binomial and BetaBinomial, there are two hyperparameters. The overdispersion parameter n for the negative Binomial is represented as

$$\theta_1 = \log(n)$$

and the prior is defined on  $\theta_1$ . The zero-inflation parameter p, is represented as

$$p = \frac{\exp(\theta_2)}{1 + \exp(\theta_2)}$$

and the prior and initial value is is given for  $\theta_2$ . For the BetaBinomial it is similar.

# Specification

```
• family="zeroinflatedbinomial0"
```

- family="zeroinflatedbinomial1"
- family="zeroinflatednbinomial0"
- family="zeroinflatednbinomial1"
- family="zeroinflatedpoisson0"

## Example

In the following example we estimate the parameters in a simulated example for both type 0 and type 1.

## Poisson

```
## type 0
n=100
a = 1
b = 1
z = rnorm(n)
eta = a + b*z
p = 0.2
E = sample(c(1,5,10,15), size=n, replace=TRUE)
lambda = E*exp(eta)
## first sample y|y>0
y = rpois(n, lambda = lambda)
is.zero = (y == 0)
while(sum(is.zero) > 0)
{
    y[is.zero] = rpois(sum(is.zero), lambda[is.zero])
    is.zero = (y == 0)
```

```
## then set some of these to zero
y[rbinom(n, size=1, prob=p) == 1] = 0
data = list(y=y,z=z)
formula = y ~ 1+z
result0 = inla(formula, family = "zeroinflatedpoisson0", data = data, E=E)
summary(result0)
## type 1
y = rpois(n, lambda = lambda)
y[ rbinom(n, size=1, prob=p) == 1 ] = 0
data = list(y=y,z=z)
formula = y ~ 1+z
result1 = inla(formula, family = "zeroinflatedpoisson1", data = data, E=E)
summary(result1)
Binomial
## type 0
n=100
a = 1
b = 1
z = rnorm(n)
eta = a + b*z
p = 0.2
Ntrials = sample(c(1,5,10,15), size=n, replace=TRUE)
prob = exp(eta)/(1 + exp(eta))
y = rbinom(n, size = Ntrials, prob = prob)
is.zero = (y == 0)
while(sum(is.zero) > 0)
    y[is.zero] = rbinom(sum(is.zero), size = Ntrials[is.zero], prob = prob[is.zero])
    is.zero = (y == 0)
y[rbinom(n, size=1, prob=p) == 1] = 0
data = list(y=y,z=z)
formula = y \sim 1+z
result0 = inla(formula, family = "zeroinflatedbinomial0", data = data, Ntrials = Ntrials)
summary(result0)
## type 1
y = rbinom(n, size = Ntrials, prob = prob)
y[ rbinom(n, size=1, prob=p) == 1 ] = 0
data = list(y=y,z=z)
formula = y ~ 1+z
result1 = inla(formula, family = "zeroinflatedbinomial1", data = data, Ntrials=Ntrials)
summary(result1)
```

## Advanced example

In the following example we estimate the parameters in a simulated example for a type0 likelihood, where one linear predictor enters the zero-probability and one other linear predictor enters the non-zero Poisson for example. The same trick can be used for other models of type0. The trick is that the likelihood

$$p^*1_{[y=0]} + (1-p^*)P(y|y>0)$$

can be reformulated as a Bernoulli likelihood for the "class"-variable

$$z = \begin{cases} 1, & \text{if } y = 0 \\ 0, & \text{if } y > 0. \end{cases}$$

where  $p^*$  is the probability for success, and zero-inflated type0 likelihood (with fixed p = 0) for those y > 0. Since  $p^*$  and the linear predictor in P is separated into two likelihoods, we can apply one linear predictor to each one, hence extend the basic model to cases where  $p^*$  also depends on a linear predictor. Here is a small simulated example doing this.

```
require(INLA)
n = 100
a = 0.5
b = 1.5
x1 = rnorm(n, sd = 0.5)
eta.z = -a - b*x1
z = rbinom(n, 1, inla.link.logit(eta.z, inverse=TRUE))
n.y = sum(z)
x2 = rnorm(n.y, sd = 0.5)
eta.y = a + b*x2
lambda = exp(eta.y)
y = rpois(n.y, lambda)
is.zero = (y == 0)
while(sum(is.zero) > 0)
   y[is.zero] = rpois(sum(is.zero), lambda[is.zero])
   is.zero = (y == 0)
}
Y = matrix(NA, n + n.y, 2)
Y[1:n, 1] = z
Y[n + 1:n.y, 2] = y
form = Y \sim 0 + mu.z + mu.y + cov.z + cov.y
ldat = list(
        Y=Y,
        mu.z=rep(1:0, c(n, n.y)),
        mu.y=rep(0:1, c(n, n.y)),
        cov.z=c(x1, rep(NA,n.y)),
        cov.y=c(rep(NA, n), x2))
```

#### Notes

None.

#### Extentions

There are some extentions available which currently is only implemented for the cases where its needed/requested.

**Type 2** Is like Type 1 but where (for the Poisson)

$$p = 1 - \left(\frac{E \exp(x)}{1 + E \exp(x)}\right)^{\alpha}$$

where  $\alpha > 0$  is the hyperparameter instead of p (and  $E \exp(x)$  is the mean). Available for Poisson as zeroinflatedpoisson2, for binomial as zeroinflatedbinomial2 and for the negative binomial as zeroinflatedpoinsonial2.

The internal representation is  $\theta = \log(\alpha)$  and prior is defined on  $\log(\alpha)$ .

# 0.0.1 Zero and N-inflated Binomial likelihood: type 3

This is the case where

$$\begin{aligned} \operatorname{Prob}(y|\ldots) &=& p_0 \times 1_{[y=0]} + \\ && p_N \times 1_{[y=N]} + \\ && (1-p_0-p_N) \times \operatorname{binomial}(y,N,p) \end{aligned}$$

where:

$$p = \frac{\exp(\eta)}{1 + \exp(\eta)} \qquad p_0 = \frac{p^{\alpha_0}}{1 + p^{\alpha_0} + (1 - p)^{\alpha_N}} \qquad p_N = \frac{(1 - p)^{\alpha_N}}{1 + p^{\alpha_0} + (1 - p)^{\alpha_N}}$$

There are 2 hyperparameters,  $\alpha_0$  and  $\alpha_N$ , governing zero-inflation where: The zero-inflation parameters  $\alpha_0$  and  $\alpha_N$  are represented as  $\theta_0 = \log(\alpha_0)$ ;  $\theta_N = \log(\alpha_N)$  and the prior and initial value is given for  $\theta_0$  and  $\theta_N$  respectively.

Here is an example

```
nsim<-10000
x<-rnorm(nsim)
alpha0<-1.5
alphaN<-2.0
p = \exp(x)/(1+\exp(x))
p0 = p^alpha0 / (1 + p^alpha0 + (1-p)^alphaN)
pN = (1-p)^alphaN / (1 + p^alpha0 + (1-p)^alphaN)
P<-cbind(p0, pN, (1-p0 -pN))
N<-rpois(nsim,20)
y<-rep(0,nsim)
for(i in 1:nsim)
    y[i] < -sum(rmultinom(1, size = 1, P[i,])*c(0, N[i], rbinom(1, N[i], p[i])))
formula = y^1 + x
r = inla(formula, family = "zeroninflatedbinomial3", Ntrials = N, verbose = TRUE,
           data = data.frame(y, x))
