Discrete generalized Pareto distribution

Parametrisation

The discrete generalized Pareto (GP) distribution with positive shape parameter has cumulative distribution function

$$F(y; \sigma, \xi) = 1 - \left(1 + \xi \frac{y+1}{\sigma}\right)^{-1/\xi}, \quad y = 0, 1, 2, \dots$$

for a discrete response y where

 ξ : is the tail parameter, $\xi > 0$

 σ : is the scale parameter, $\sigma > 0$

Link function

The linear predictor η controls the α quantile of the corresponding continuous GP

$$P(y \le q_{\alpha}) = \alpha$$

and $q_{\alpha} = \exp(\eta)$. The scaling σ , is then a function of (q_{α}, ξ) , as

$$\sigma = \frac{\xi \exp(\eta)}{(1 - \alpha)^{-\xi} - 1}$$

Hyperparameters

The GP model has one hyperparameter. The tail $\xi > 0$ is represented as

$$\xi = \xi_{\text{low}} + (\xi_{\text{high}} - \xi_{\text{low}}) \frac{\exp(\theta)}{1 + \exp(\theta)}$$

and the prior is defined on θ , with constant low and high values. The prior is FIXED to pc.gevtail, see inla.doc("pc.gevtail") for more info.

Specification

- family="dgp"
- Required arguments: y and the quantile α .

The quantile is given as control.family=list(control.link=list(quantile= α)).
