# A special case of the Gamma-distribution

#### Parametrisation

We consider this distribution

$$\pi(y) = \frac{1}{\Gamma(a)} y^{a-1} \exp(-y), \quad a > 0, \quad y > 0,$$

where  $E(y) = \mu = a$ .

### Link-function

The linear predictor  $\eta$  is linked to the mean  $\mu$  using a default log-link

$$\mu = \exp(\eta)$$

## Hyperparameter

None.

# Specification

- family="gammajw" for regression models and family="gammajw.surv" for survival models.
- Required arguments: for gammajw.surv, y (to be given in a format by using inla.surv()), and for gammajw, y.

Example
In the following example we estimate the parameters in a simulated example.
n <- 300
x \leftarrow rnorm(n, sd = 0.3)
eta <- 1 + x
mu <- exp(eta)</pre>
y <- rgamma(n, shape = mu, scale = 1)
r \leftarrow inla(y ~1 + x,
          data = data.frame(y, x),
          family = "gammajw",
          control.compute = list(cpo = TRUE),
          control.fixed = list(prec.intercept = 0.01),
          verbose = TRUE)
```

## Notes
