New 0inflated models: Poisson & Binomial

Parametrisation

This is a new implementation (Nov'22) of zero-inflated Poisson and Binomial likelihood, where we will allow for a linear predictor in both the zero-inflattion and in the mean, but one of them needs to consists of fixed effects only. This means the setup will be somewhat different that for other likelihood models.

Details

The zero-inflated likelihood $f_0(y|\ldots)$ is defined as

$$f_0(y|\eta_1,\eta_2) = p(\eta_1)1_{[y=0]} + (1-p(\eta_1))f(y|\eta_2)$$

where f(y|...) is either Poisson or Binomial. We allow for two linear predictors in the model, but one needs to be "simple" (i.e. only consists of fixed effects). The other is general and defined via the formula. Normally, the zero-inflation probability is simpler (family="0...")

$$\eta_1 = \text{simple} \qquad \eta_2 = \text{formula}$$

but they can also be swapped (family="0...S")

$$\eta_1 = \text{formula} \qquad \eta_2 = \text{simple}$$

Link-function

This is similar to Poisson and Binomial.

The link-function for the 'simple'-model must be given by argument link.simple in the control.family-argument. Only link-models without covariates/parameters are currently available. The examples later on shows how this is done.

Hyperparameters

All parameters in the simple model are treated as hyperparameters. The j'th element of η_1 is

$$(\eta_1)_j = \sum_{i=1} m\beta_i x_{ij}$$

for covariates $x_1, \ldots,$ where m is maximum 10. An intercept in this model have to be defined manually by adding a constant covariate vector.

Specification

- family="Opoisson"
- family="OpoissonS"
- family="Obinomial"
- family="ObinomialS"
- Required arguments: As for the Poisson and Binomial (but how these arguments are given, will differ). Optional argument link.simple.

Hyperparameter spesification and default values
