## Generalized Pareto distribution

## Parametrisation

The generalized Pareto (GP) distribution with positive shape parameter has cumulative distribution function

$$F(y; \sigma, \xi) = 1 - \left(1 + \xi \frac{y}{\sigma}\right)^{-1/\xi}, \quad y > 0,$$

for a continuous response y where

 $\xi$ : is the tail parameter,  $\xi > 0$ 

 $\sigma$ : is the scale parameter,  $\sigma > 0$ 

The limit for  $\xi \downarrow 0$  is  $F(y; \sigma, 0) = 1 - \exp(-x/\sigma)$ .

## Link function

The linear predictor  $\eta$  controls the  $\alpha$  quantile of the GP

$$P(y \le q_{\alpha}) = \alpha$$

and  $q_{\alpha} = \exp(\eta)$ . The scaling  $\sigma$ , is then a function of  $(q_{\alpha}, \xi)$ , as

$$\sigma = \frac{\xi \exp(\eta)}{(1 - \alpha)^{-\xi} - 1}$$

## Hyperparameters

The GP model has one hyperparameter. The tail  $\xi > 0$  is represented as

$$\xi = \xi_{\text{low}} + (\xi_{\text{high}} - \xi_{\text{low}}) \frac{\exp(\theta)}{1 + \exp(\theta)}$$

and the prior is defined on  $\theta$ , with constant low and high values. The prior is FIXED to pc.gevtail, see inla.doc("pc.gevtail") for more info.

# Specification

- family="gp"
- Required arguments: y and the quantile  $\alpha$ .

The quantile is given as control.family=list(control.link=list(quantile= $\alpha$ )).

Example
rgp = function(n, sigma, eta, alpha, xi = 0.001)
    if (missing(sigma)) {
        stopifnot(!missing(eta) && !missing(alpha))
        sigma = exp(eta) * xi / ((1.0 - alpha)^(-xi) -1.0)
    return (sigma / xi * (runif(n)^(-xi) -1.0))
n = 300
x = runif(n) - 0.5
eta = 1+x
alpha = 0.95
xi = 0.3
y = rgp(n, eta = eta, alpha = alpha, xi=xi)
```

### Notes

The prior for  $\xi$  is fixed to pc.gevtail or one that respect an given interval similarly. Note that the default prior (and the internal representation of it and its name) changed 2019/10/12.
