logdist effect of a covariate

Parametrization

This model implements a non-linear effect of a positive covariate x as a part of the linear predictor,

$$\beta \left(1 + \exp(\alpha_1 \log(x) - \alpha_2 x)\right)$$

where $\beta \in \Re$, $\alpha_1, \alpha_2 \in \Re^+$ and $x \ge 0$.

Hyperparameters

This model has three hyperparameters, the scaling β , α_1 and α_2 .

$$\theta_1 = \beta$$
 $\theta_2 = \log(\alpha_1)$ $\theta_3 = \log(\alpha_2)$

and the priors are given for θ_1, θ_2 and θ_3 .

Specification

```
f(x, model="logdist", hyper = ..., precision = <precision>)
```

where precision is the precision for the tiny noise used to implement this as a latent model.

Hyperparameter specification and default values

```
\operatorname{\mathbf{doc}} A nonlinear model of a covariate
```

Example
logdist = function(x, beta, alpha)
{
    return (beta * (1 + \exp(alpha[1] * \log(x) - alpha[2] * x)))
n = 1000
s=0.1
x = runif(n)
beta = 1
alpha = c(1, 0.5)
## start at the true values
hyper = list(
    beta = list(initial = beta),
    a1 = list(initial = log(alpha[1])),
    a2 = list(initial = log(alpha[2])))
## start somewhere else
hyper = list(
    beta = list(initial = 1),
    a1 = list(initial = 0),
    a2 = list(initial = 0))
y = logdist(x, beta, alpha) + rnorm(n, sd = s)
```
