# `pc.gammacount`: The PC prior for $\theta = \log(a)$ in the $\Gamma(a, 1)$ distribution with base model $a = 1$

## Parametrization

This is the PC prior for $\theta = \log(a)$ in the $\Gamma(a, 1)$ distribution[1] distribution where $a = 1$ is the base model.

## Specification

This prior for the hyperparameter is specified in the `hyper`-spesification, for $\theta = \log(a)$ it is

```
hyper = list(<theta> = list(prior="pc.gammacount", param=c(<lambda>)))
```

## Example

## Notes

See also functions `inla.pc.{d,p,q,r}gammacount` which gives the same PC prior, but for $a$ instead of $\theta = \log(a)$.
**This function is experimental.**

[1] Where $\Gamma(a, b)$ has mean $a/b$ and variance $a/b^2$.
